The **TAWC Heat Unit Calculator** is a simple calculator that allows you to calculate the total accumulation of heat units for both Corn and Cotton. The only input required is a start (planting) and end date for either corn or cotton and the total accumulation for that period will be calculated. Date selection is made by clicking the calendar icon to the right of the start and end date and selecting the day from the popup calendar. Upon entry of the start date the input will advance to the end date input for each crop.

If you wish to observe daily heat units for any given day, that information is provided in the data column for “Crop” Heat Units. The Total “Crop” Heat Unit column is a running tally of daily heat units since the climate data start on 4/1/2017. Heat Unit climate data is manually entered on a weekly basis and heat unit data and calculation is only available from 4/1/2017 through the previous Friday of the current week. We hope to automat this process in a future release.
